

Agency bill

BillingCenter supports two models of billing: direct bill and agency bill. In the agency bill model, the producer invoices policyholders and receives payment from them. The producer then sends payment to BillingCenter, withholding the producer's commission earned on the policies. Agency bill payments typically include payments for multiple policies.

The following topics contain information on working with agency bill functionality through Cloud API.

For information on working with agency bill plans, see “Agency bill plans” on page 203.

Statement invoices

A *statement invoice* is an itemized bill requesting payment that is due to an insurer from an agency bill producer for a single agency bill period. *Statement invoice* is Cloud API's term for agency bill statements.

Note: Sometimes the terms "agency bill statement," "statement invoice," "statement," and "invoice" are used interchangeably in BillingCenter. For example, an agency bill statement's identifying number is referred to as **Statement #** in the user interface and `invoiceNumber` in Cloud API. This is because in the data model, agency bill statements are a subtype of invoice.

To learn about statement invoices, see the *BillingCenter Application Guide*.

You can query for statement invoices using Cloud API.

Querying for statement invoices

Use the following endpoint to retrieve all of a producer's statement invoices:

- GET `billing/v1/producers/{producerId}/invoices`

You can also retrieve an individual statement invoice using the following endpoint. (Note that this endpoint can be used to retrieve account invoices as well.)

- GET `/invoices/{invoiceId}`

For example, the following request retrieves all statement invoices on producer `bc:154`.

Command

```
GET /billing/v1/producers/bc:154/invoices
```

Response

```
{
  "count": 12,
  "data": [
    {
      "attributes": {
        "adHoc": false,
        "amount": {
          "amount": "1050.00",
          "currency": "usd"
        },
        "amountDue": {
          "amount": "0.00",
          "currency": "usd"
        },
        "eventDate": "2025-03-15",
        "id": "bc:SE0WN2N-xkYzmm_i1HFgK",
        "invoiceNumber": "1000000063",
        "netAmount": {
          "amount": "1050.00",
          "currency": "usd"
        },
        "netAmountPaid": {
          "amount": "1000.00",
          "currency": "usd"
        },
        "paymentDueDate": "2025-04-29",
        "status": {
          "code": "due",
          "name": "Due"
        },
        "subtype": "StatementInvoice"
      },
      "checksum": "4",
      "links": {
        "self": {
          "href": "/billing/v1/invoices/bc:SE0WN2N-xkYzmm_i1HFgK",
          "methods": [
            "get",
            "patch"
          ]
        }
      }
    },
    {
      "attributes": {
        "adHoc": false,
        "amount": {
          "amount": "500.00",
          "currency": "usd"
        },
        "amountDue": {
          "amount": "0.00",
          "currency": "usd"
        },
        ...
      }
    }
  ]
}
```

You can add query parameters to filter or sort the returned statement invoices. For example, to retrieve only billed invoices, you could add the following to the end of the request: `?filter=status:eq:billed`.

Querying for a single invoice

The following request retrieves a single statement invoice.

Command

```
GET /billing/v1/invoices/bc:235
```

Response

```
{
  "data": {
    "attributes": {
      "adHoc": false,
      "allInvoiceItemsExactlyPaid": false,
      "amount": {
        "amount": "860.00",
        "currency": "usd"
      },
      "amountDue": {
        "amount": "560.00",
        "currency": "usd"
      }
    }
  }
}
```

```

    },
    "eventDate": "2025-05-15",
    "id": "bc:235",
    "invoiceNumber": "1000000065",
    "netAmount": {
      "amount": "860.00",
      "currency": "usd"
    },
    "netAmountPaid": {
      "amount": "300.00",
      "currency": "usd"
    },
    "paymentDueDate": "2025-06-29",
    "primaryDirectBillEarned": {
      "amount": "0.00",
      "currency": "usd"
    },
    "status": {
      "code": "due",
      "name": "Due"
    },
    "subtype": "StatementInvoice"
  },
  ...
}

```

Agency bill cycles

BillingCenter uses agency bill statements to bill producers for agency bill policies. BillingCenter manages the billing of statements using *agency bill cycles*.

From the perspective of Cloud API, an agency bill cycle serves as a container for information about the billing of a single statement. An agency bill cycle contains information about:

- The primary statement for that agency bill cycle. A statement is used to record the money that is due to the insurer from the producer for that agency bill period.
- The workflow of events in the agency bill cycle for that statement.

Note: Sometimes the terms "agency bill statement," "statement invoice," "statement," and "invoice" are used interchangeably in BillingCenter. For example, an agency bill statement's identifying number is referred to as **Statement #** in the user interface and `invoiceNumber` in Cloud API. This is because in the data model, agency bill statements are a subtype of invoice.

For more information on agency bill cycles, see the *BillingCenter Application Guide*.

You can query for agency bill cycles using Cloud API.

Querying for agency bill cycles

Use the following endpoints to query for a producer's agency bill cycles:

- GET `/billing/v1/producers/{producerId}/agency-bill-cycles`
- GET `/billing/v1/producers/{producerId}/agency-bill-cycles/{agencyBillCycleId}`

Most agency bill cycle information is contained in the `statementInvoice` field and the `agencyCycleProcess` field.

- The `statementInvoice` field captures information about the statement. The statement tracks the money that is due to the insurer from the producer.
- The `agencyCycleProcess` captures information about the agency bill workflow for that statement. This object contains Booleans indicating whether steps in the process have been executed and dates for when those steps were executed.

The following fields in `statementInvoice` are not returned by default when retrieving a collection of agency bill cycles, but are returned when retrieving a single agency bill cycle:

- `allInvoiceItemsExactlyPaid`
- `primaryDirectBillEarned`

These fields can also be returned by specifying a `?fields=*detail` or `?fields=*all` query parameter for the collection endpoint.

For example, the following call retrieves a single agency bill cycle:

Command

```
GET /billing/v1/producers/bc:154/agency-bill-cycles/bc:213
```

Response

```
{
  "data": {
    "attributes": {
      "agencyCycleProcess": {
        "currency": {
          "code": "usd",
          "name": "USD"
        },
        "dunning1Sent": false,
        "dunning2Sent": false,
        "genPastDueExceptionDate": "2025-06-30T00:00:00.000Z",
        "id": "bc:SmsQ933zikf1aob-lRRFu",
        "pastDueExceptionDismissed": false,
        "pastDueExceptionGenerated": false,
        "promiseExceptionDismissed": false,
        "promiseExceptionGenerated": false,
        "promiseReminderSent": false,
        "sendStatementDate": "2025-05-15T00:00:00.000Z",
        "statementSent": true
      },
      "currency": {
        "code": "usd",
        "name": "USD"
      },
      "id": "bc:213",
      "statementInvoice": {
        "adHoc": false,
        "allInvoiceItemsExactlyPaid": false,
        "amount": {
          "amount": "860.00",
          "currency": "usd"
        },
        "amountDue": {
          "amount": "560.00",
          "currency": "usd"
        },
        "eventDate": "2025-05-15",
        "id": "bc:235",
        "invoiceNumber": "1000000065",
        "netAmount": {
          "amount": "860.00",
          "currency": "usd"
        },
        "netAmountPaid": {
          "amount": "300.00",
          "currency": "usd"
        },
        "paymentDueDate": "2025-06-29",
        "primaryDirectBillEarned": {
          "amount": "0.00",
          "currency": "usd"
        },
        "status": {
          "code": "billed",
          "name": "Billed"
        },
        "subtype": "StatementInvoice"
      }
    },
    ...
  }
}
```

In this example, the statement has been sent, but no other steps in the agency bill workflow process have been executed.

The statement has been partially paid, and provides fields for how much has been paid and how much needs to be paid for the statement to be settled.

Agency bill payments

In the agency bill approach to billing, the producer invoices policyholders and receives payment from them. The producer withholds their commission and sends the net payment to the insurer as an agency bill payment.

When BillingCenter receives an agency bill payment, BillingCenter places the payment into the producer's unapplied fund. The payment can either remain in the unapplied fund, or it can be taken from the unapplied fund and distributed to settle invoice items for agency bill policies.

Cloud API supports the following operations related to working with agency bill payments:

- Querying for agency bill payments
- Creating agency bill payments with and without distribution
- Retrieving agency bill distribution information
- Creating agency bill payments in suspense
- Modifying agency bill payments and distributions
- Executing saved agency bill payments
- Deleting agency bill payments
- Retrieving information about agency bill distributions
- Retrieving payment mismatch exceptions
- Resolving payment mismatch exceptions

Note the following business entities related to agency bill payments and the corresponding objects in Cloud API:

- *Agency bill payment* - The money received from a producer for one or more agency bill policies. The `AgencyBillMoneyRcvd` object contains information about agency bill payments.
- *Agency bill distribution* - Refers to how an agency bill payment is distributed to settle invoice items. The `agencyCyclePayment` object contains agency bill distribution information.
- *Distribution items* - A portion of an agency bill distribution that is applied to a single invoice item. `agencyPaymentItem` objects contain information about distribution items.

As of this release, Cloud API only supports the Statement Bill approach to agency bill.

Query for agency bill payments

You can query for a producer's agency bill payments using the following endpoints:

- GET `/billing/v1/producers/{producerId}/ab-money-rcvds`
- GET `/billing/v1/producers/{producerId}/ab-money-rcvds/{agencyBillMoneyRcvdId}`

These endpoints retrieve agency bill payments regardless of what state they are in. Returned payments may be saved, executed, reversed, or modified.

The following request retrieves a single agency bill payment of \$340 USD.

Command

```
GET /billing/v1/producers/bc:423/ab-money-rcvds/bc:435
```

Response

```
{
  "data": {
    "attributes": {
      "amount": {
        "amount": "340.00",
        "currency": "usd"
      },
      "appliedDate": "2024-10-27T15:57:52.333Z",
    }
  }
}
```

```
    "currency": {
      "code": "usd",
      "name": "USD"
    },
    "id": "bc:S1PUf1dPanQLwWqk0iIY9",
    "modified": false,
    "paymentInstrument": {
      "displayName": "Check",
      "id": "bc:Sad-gdQzXPb79g-_vKMph",
      "type": "UniversalPaymentInstrument",
      "uri": "/billing/v1/universal-payment-instruments/bc:Sad-gdQzXPb79g-_vKMph"
    },
    "receivedDate": "2024-10-27T15:54:44.282Z",
    "subtype": "AgencyBillMoneyRcvd"
  },
  ...
}
```

Retrieving modified agency bill payments

When an agency bill payment is modified, BillingCenter creates an entirely new payment entity while preserving the original payment entity in the database. Therefore, the Cloud API may return more payments than what appears in the user interface.

Cloud API returns both payments that were created as a result of modification and the original payments before they were modified. To only display current payments and omit payments that have been changed, use the `?filter=modified:eq:false` query parameter in the GET request.

The original pre-modification payments are preserved for record keeping. For more, see “Modify agency bill payments and distributions” on page 337.

Create and distribute agency bill payments

Agency bill payments can be entered into BillingCenter using the following endpoint:

- POST `/billing/v1/producers/{producerId}/ab-money-rcvds`

When creating an agency bill payment through Cloud API, you can either distribute it immediately, or you can enter it without distribution and manually distribute it later through the BillingCenter user interface. Whether the payment is distributed immediately or not depends on the body of the POST request. Both of these scenarios are described in the following sections.

For more on agency bill distributions in BillingCenter, see the *BillingCenter Application Guide*.

Create an agency bill payment without distribution

To create an agency bill payment without distribution, the following fields are required:

Field	Type	Description
amount	MonetaryAmount object	The net amount of the agency bill payment.
currency	Typekey reference to the Currency typelist	The currency of the payment.
paymentInstrument	Object containing a simple reference to the payment instrument’s id	The payment instrument used to make the payment. Must be cash universal payment instrument associated with the producer. See “Universal payment instruments” on page 313.
receivedDate	String	The date the payment was received, in the format YYYY-MM-DD.

The following example request creates a \$200 payment. Because no distribution is specified, \$200 is added to the producer’s unapplied fund.

Command

```
POST /billing/v1/producers/bc:423/ab-money-rcvds
```

Request body

```
{
  "data": {
    "attributes": {
      "amount": {
        "amount": "200",
        "currency": "usd"
      },
      "currency": {
        "code": "usd"
      },
      "paymentInstrument": {
        "id": "bc:Sad-gdQzXPb79g-_vKMph"
      },
      "receivedDate": "2024-10-10"
    }
  }
}
```

Create an agency bill payment with distribution

To create a payment and distribute it, you must include an additional `agencyCyclePayment` object in the POST request. This object has the following required fields:

- `currency`, a typekey reference
- Either `agencyPaymentItems` or `agencySuspPmntItems` or both—both are arrays of objects

Note: This topic only discusses agency payment items, which are used to distribute funds to invoice items. You can also include agency bill suspense payment items using the `agencySuspPmntItems` object. For information on agency bill suspense items in Cloud API, see “Agency bill suspense items” on page 344.

Each object in the `agencyPaymentItems` array specifies distribution for a single invoice item. The following fields are required for each object in the `agencyPaymentItems` array:

Field	Type	Description
<code>invoiceItem</code>	Object containing a simple reference to an invoice item's id	The id of the target invoice item.
<code>commissionAmountToApply</code>	Monetary amount object	The commission that the producer withholds for that invoice item.
<code>grossAmountToApply</code>	Monetary amount object	The gross amount that will be applied to that invoice item.
<code>currency</code>	Typekey reference to the Currency typelist	The currency of the invoice item.
<code>disposition</code>	Typekey reference to the <code>DistItemDisposition</code> typelist	The action BillingCenter takes to address invoice items that have been overpaid, such as creating exceptions or writing off the difference. See Underpaying invoice items in the <i>Cloud API Developer Guide</i> for more information on how the different values affect behavior.

Finding the gross and commission amounts due for an invoice item

You can find the gross and commission due on an invoice item using the GET `/billing/v1/charges/{chargeId}/invoice-items/{invoiceItemId}` endpoint.

The following fields on invoice items are useful when calculating distribution amounts:

- `amount` - the gross amount on that invoice item
- `primaryCommissionAmount` - the commission amount that the producer is expected to retain
- `grossSettled` - the gross amount on the invoice item that has been settled (when subtracted from the gross amount, can be used to calculate the unpaid gross for the invoice for the invoice item)
- `primaryCommissionReserve` - the unpaid commission for the invoice

For more, see “Working with invoice items” on page 276.

Example payment and distribution

The following creates a payment and distributes it to two invoice items.

Note the following about this request:

- The net amount that the insurer receives from the producer is \$140.00 USD.
- The total amount distributed to the invoice items is \$175.50 USD.
 - This is calculated as the gross minus the commission for both invoice items. In this request, it is calculated as follows: $(95.00 - 9.50) + (100.00 - 10.00) = 175.50$
- The net provided by the producer is less than the amount that is distributed. This means that the agency bill payment will be over-distributed. The difference (-35.50) is added to the producer's unapplied fund.
- The disposition for both invoice items is `autoexception`, meaning that an exception is created only when there is a payment mismatch between the expected amount and the provided amount.

Command

```
POST /billing/v1/producers/bc:423/ab-money-rcvds
```

Request body

```
{
  "data": {
    "attributes": {
      "agencyCyclePayment": {
        "agencyPaymentItems": [
          {
            "invoiceItem": {
              "id": "bc:S7ucVhmRCNCXawTskyeNj"
            },
            "commissionAmountToApply": {
              "amount": "9.50",
              "currency": "usd"
            },
            "currency": {

      },
      "paymentInstrument": {
        "id": "bc:Sw5rLwG091j0XgxE3HeFa"
      }
    }
  }
}
```

```

    "receivedDate": "2024-06-23"
  }
}

```

Differences between distribution in the user interface and in Cloud API

When creating a distribution, there are some settings that can be set when working in the user interface that cannot be set through Cloud API.

- **Distributing a payment after creating it** - In the BillingCenter user interface, you can create a credit distribution after creating a payment. You cannot create a credit distribution in Cloud API after the call to create a payment.
- **Specifying gross versus net amounts** - When distributing payments in the user interface, you can specify the net amount that is applied to each invoice item rather than the gross and the commission. When distributing payments using Cloud API, you must specify both the gross amount and the commission amount for each item. (The net is the difference between these values.)
- **Fully pay invoice items** - In the **Agency Bill Payment** wizard, users have the option to fully pay selected invoice items without specifying invoice item amounts. This is not offered in Cloud API.

Creating a saved agency bill payment

A saved payment is a set of information pertaining to the draft of a payment. This can include information on how to distribute the payment. Saved payments are saved to the BillingCenter database, but no financial transactions have been created and no T-account amounts have been adjusted.

To create a saved payment through Cloud API, set the `saved` field to `true` in the request body.

When creating a saved payment, you must include a distribution for the payment by including the `agencyCyclePayment` object. However, distribution items and agency bill suspense items are optional for saved agency bill payments. For example, the following is a minimal request body for creating a saved agency bill payment:

```

{
  "data": {
    "attributes": {
      "agencyCyclePayment": {
        "currency": {
          "code": "usd"
        }
      },
      "amount": {
        "amount": "140.00",
        "currency": "usd"
      },
      "currency": {
        "code": "usd"
      },
      "paymentInstrument": {
        "id": "bc:SqHIz10LI89qiZMapbZGf"
      },
      "receivedDate": "2024-06-23",
      "saved": true
    }
  }
}

```

This payload results in a saved payment for 140 dollars with no distribution information. It remains in the saved state until it is executed or deleted.

Retrieve payment distribution information

After a payment has been distributed, you can retrieve information about the distribution. This information is captured in two objects:

- An *agency cycle payment* object, used to record the total funds distributed for the payment. The BillingCenter user interface uses the term "agency bill distribution."
- *Agency payment item* objects, which are children of agency cycle payments, used to record the funds distributed to each invoice item in the agency cycle payment. The BillingCenter user interface uses the term "

The terms *agency cycle payment* and *agency payment item* are unique to Cloud API. The information contained in these objects can be found in the **Executed Payments** screen and the **Agency Item Events** screen in the BillingCenter user interface.

Retrieve agency cycle payments

Retrieve an agency cycle payment using one of the following endpoints:

- GET /producers/{producerId}/ab-money-rcvds/{agencyBillMoneyRcvdId}/agency-cycle-payments
- GET /billing/v1/producers/{producerId}/ab-money-rcvds/{agencyBillMoneyRcvdId}/agency-cycle-payments/{agencyCyclePaymentId}

Note: There is never more than one agency cycle payment for an agency bill payment, so the two endpoints will always return the same agency cycle payment object (if the payment was distributed). Both the collection GET and the element GET are provided in BillingCenter for data model consistency with other Cloud API endpoints.

The following is an example of retrieving the agency cycle payment on an agency bill payment. It uses the collection GET endpoint, so it retrieves an array with only one item in it.

Command

```
GET /billing/v1/producers/bc:423/ab-money-rcvds/bc:544/agency-cycle-payments
```

Response

```
{
  "count": 1,
  "data": [
    {
      "attributes": {
        "currency": {
          "code": "usd",
          "name": "USD"
        },
        "distributedDate": "2024-09-19T20:39:53.788Z",
        "id": "bc:SJcEleJmwtc6b3DoFMpdt",
        "netDistributedToInvoiceItems": {
          "amount": "143.60",
          "currency": "usd"
        },
        "netInSuspense": {
          "amount": "0.00",
          "currency": "usd"
        }
      },
      "checksum": "0",
      "links": {
        "self": {
          "href": "bc:423/ab-money-rcvds/bc:544/agency-cycle-payments/bc:591",
          "methods": [
            "get"
          ]
        }
      }
    }
  ]
}
```

Retrieving distribution items

Retrieve distribution items using the following endpoints:

- GET /producers/{producerId}/ab-money-rcvds/{agencyBillMoneyRcvdId}/agency-cycle-payments/{agencyCyclePaymentId}/agency-payment-items
- GET /producers/{producerId}/ab-money-rcvds/{agencyBillMoneyRcvdId}/agency-cycle-payments/{agencyCyclePaymentId}/agency-payment-items/{agencyPaymentItemId}

The following example retrieves a single distribution item. In the case of this invoice item, there is a \$95.00 gross amount that was applied to the invoice, and a \$9.50 commission amount that was withheld.

Note the following about distribution items:

- The fields `commissionAmountToApply` and `grossAmountToApply` reflect the amounts that were distributed or withheld for the invoice item as a result of the distribution.

Command

```
GET /billing/v1/producers/bc:423/ab-money-rcvds/bc:544/agency-cycle-payments/bc:545/agency-payment-items/bc:546
```

Response

```
{
  "data": {
    "attributes": {
      "commissionAmountToApply": {
        "amount": "9.50",
        "currency": "usd"
      },
      "currency": {
        "code": "usd",
        "name": "USD"
      },
      "disposition": {
        "code": "autoexception",
        "name": "Automatic"
      },
      "grossAmountToApply": {
        "amount": "95.00",
        "currency": "usd"
      },
      "id": "bc:546",
      "invoiceItem": {
        "displayName": "09/18/2024 ($95.00)",
        "id": "bc:S9xfKCx-ufS1TGNfuzGQR",
        "type": "InvoiceItem",
        "uri": "/billing/v1/charges/bc:SQLjfspJvWZAwwZlyFDg9T/invoice-items/bc:S9xfKCx-ufS1TGNfuzGQR"
      }
    },
    ...
  }
}
```

In some cases, you may want to filter out reversed distribution items. Use the query parameter `?filter=reversedDate:eq:null` when you execute the GET to exclude reversed distribution items.

Agency bill payments in suspense

Agency bill payments, like direct bill payments, can initially be created as suspense payments through Cloud API. Agency bill suspense payments can be applied to a producer in the same way that direct bill suspense payments can be applied to policies or accounts. For information on applying suspense payments, see “Applying suspense payments” on page 296. For applying agency bill suspense payments, you specify the producer’s ID instead of the account ID or policy ID.

When applied, agency bill suspense payments are added to the target producer’s unapplied fund and recorded as an agency bill payment transaction.

Modify agency bill payments and distributions

After an agency bill payment has been executed, you can update the payment and its distribution, including any distribution items and suspense items. You can modify agency bill payments using Cloud API.

Use the following endpoint to modify agency bill payments.

- POST `/billing/v1/producers/{producerId}/ab-money-rcvds/{agencyBillMoneyRcvdId}/modify`

For information about modifying agency bill payments in the BillingCenter user interface, see “Agency bill payments” on page 331.

How BillingCenter handles agency bill payment modification

Agency bill payments must be executed to be modified, and they cannot have been previously modified.

When you modify an agency bill payment, BillingCenter does not update values on the existing payment. Instead, it creates a brand new agency bill payment based on the original. Therefore, modifying a payment results in two payments in the BillingCenter database:

- The original payment, with the `modified` field set to `true`. The original payment cannot be modified again, and BillingCenter preserves it only for record keeping.
- The modifying payment, created as a new payment with values from the original payment and new values set during the modification. In Cloud API, modifying payments include a `moneyBeingModified` field, which associates the modifying payment with the original payment.

The BillingCenter user interface only shows the modifying payment, not the original payment. However, BillingCenter Cloud API returns both modifying and original payments when you call the `GET /billing/v1/producers/{producerId}/ab-money-rcvds` endpoint. See “Query for agency bill payments” on page 331 for more.

How BillingCenter handles distribution modification

To modify distribution items and suspense items, include the `agencyCyclePayment` object in the request body. When `agencyCyclePayment` is included in the request, it creates a new agency bill distribution on the modifying agency bill payment. You can specify new data for existing distribution items and suspense items in the new agency bill distribution.

Like agency bill payments, when a distribution item or a suspense item is modified, the item itself is not updated. Instead, BillingCenter creates a brand new item based on the original. This results in two items in the BillingCenter database:

- The original item, with the `reversedDate` field populated. This item does not appear in the user interface, but it can be retrieved using Cloud API.
- The modifying item, which has relevant values from the original item and the request. This item appears in the user interface and can be retrieved using Cloud API

When modifying a payment, BillingCenter requires that an `id` be included for all distribution items and all suspense items, including items that are not being modified. This is explained in the following sections.

Modifying distribution items

If there are distribution items on the distribution, then the `agencyPaymentItems` array must be included in the `agencyCyclePayment` object. All the distribution items on the payment must be included in the `agencyPaymentItems` array. When distribution items are modified, funds are moved in the T-accounts to account for amount differences.

For distribution items, the `id` of the target invoice item is used to identify the distribution item. For example, if there is a distribution item which targets the invoice item `bc:invoiceItem1`, the following object must be included in the `agencyPaymentItems` array:

```
{
  "invoiceItem": {
    "id": "bc:invoiceItem1"
  }
}
```

When modifying distribution items, BillingCenter searches for an existing distribution item targeting the specified invoice item. If there is not a matching distribution item, BillingCenter attempts to create a new distribution item. If there is not an appropriate invoice item with the `id` specified on the modifying distribution item, BillingCenter throws an error. Because there are no other fields specified in this example, BillingCenter does not modify the distribution item.

BillingCenter attempts to match modifying distribution and suspense items to existing items.

Modifying suspense items

If there are suspense items on the distribution, then the `agencySuspPmntItems` array must be included in the `agencyCyclePayment` object. All the suspense items on the payment must be included in the array. When a suspense item is modified, no T-accounts are updated, as items in suspense do not have T-accounts.

For suspense items, the id of the suspense item itself is used to identify the suspense item. For example, if the distribution includes a suspense item which targets the suspense item bc:suspItem1, the following entry must be included in the agencySuspPmntItems array:

```
{
  "id": "bc:suspItem1"
}
```

Because there are no other fields specified in this example, BillingCenter does not modify the suspense item.

When modifying suspense items, BillingCenter searches for an existing suspense item with the id of the modifying suspense item. If there is not a matching suspense item, BillingCenter attempts to create a new suspense item with the information on the modifying suspense item. If there is not sufficient information to create a new suspense item, BillingCenter throws an error.

Modifying an agency bill distribution example

The following example illustrates modifying distribution items and suspense items on a distribution.

Suppose there is an agency bill payment with two distribution items and two suspense items. The distribution items were distributed to invoice items with ids bc:invoiceItem1 and bc:invoiceItem2. The suspense items have ids bc:suspItem1 and bc:suspItem2.

A caller wants to modify the distribution item targeting invoice item bc:invoiceItem1 and the suspense item bc:suspItem1. No other fields of the agency bill payment are modified. The request looks like this:

Command

```
POST /billing/v1/producers/bc:433/ab-money-rcvds/bc:698/modify
```

Request body

```
{
  "data": {
    "attributes": {
      "agencyCyclePayment": {
        "agencyPaymentItems": [
          {
            "invoiceItem": {
              "id": "bc:invoiceItem1"
            },
            "commissionAmountToApply": {
              "amount": "10",
              "currency": "usd"
            },
            "disposition": {
              "code": "autoexception"
            },
            "grossAmountToApply": {
              "amount": "100",
              "currency": "usd"
            }
          },
          {
            "invoiceItem": {
              "id": "bc:invoiceItem2"
            }
          }
        ],
        "agencySuspPmntItems": [
          {
            "id": "bc:suspItem1",
            "commissionAmountToApply": {
              "amount": "5.00",
              "currency": "usd"
            },
            "currency": {
              "code": "usd"
            },
            "grossAmountToApply": {
              "amount": "50.00",
              "currency": "usd"
            }
          },
          {
            "id": "bc:suspItem2"
          }
        ]
      }
    }
  }
}
```

```

    }
  }
}

```

As a result of the modification, there are now three distribution items and three suspense items:

- Distribution item for invoice item `bc:invoiceItem1` (reversed)
- Distribution item for invoice item `bc:invoiceItem1` (the modifying item)
- Distribution item for invoice item `bc:invoiceItem2` (unchanged by the modification)
- Suspense item `bc:suspItem1` (reversed)
- Suspense item `bc:suspItem1` (the modifying item)
- Suspense item `bc:suspItem2` (unchanged by the modification)

Detailed agency bill payment modification example

Select fields on the payment can be modified, such as amount, name, and payment instrument.

The following call demonstrates the fields you can modify on an agency bill payment. It also modifies the distribution of the payment, including one modifying distribution item, five unmodified distribution items, one modifying suspense item, and one unmodified suspense item.

Command

```
POST /billing/v1/producers/bc:48/ab-money-rcvds/bc:1091/modify
```

Request body

```

{
  "data": {
    "attributes": {
      "agencyCyclePayment": {
        "agencyPaymentItems": [
          {
            "invoiceItem": {
              "id": "bc:Stzu1G0y9QWr1TForCR8r"
            },
            "commissionAmountToApply": {
              "amount": "10",
              "currency": "usd"
            },
            "disposition": {
              "code": "autoexception"
            },
            "grossAmountToApply": {
              "amount": "100",
              "currency": "usd"
            }
          },
          {
            "invoiceItem": {
              "id": "bc:SDHrGwNQ-znIhsdqVHaIq"
            }
          },
          {
            "invoiceItem": {
              "id": "bc:S5f1peqGip09il_dxbiUH"
            }
          },
          {
            "invoiceItem": {
              "id": "bc:SM5n1fVX-Fxkne2DqdfVn"
            }
          },
          {
            "invoiceItem": {
              "id": "bc:Sp56RT7qo90ZxbeduF-fc"
            }
          },
          {
            "invoiceItem": {
              "id": "bc:Svs_g18sbQwgmIf-Skma3"
            }
          }
        ],
        "agencySuspPmntItems": [
          {

```

```

        "id": "bc:Sc7WC05j0DIttDN6cZiJb",
        "commissionAmountToApply": {
          "amount": "5.00",
          "currency": "usd"
        },
        "currency": {
          "code": "usd"
        },
        "grossAmountToApply": {
          "amount": "100.00",
          "currency": "usd"
        },
        "policyNumber": "bc:192843"
      },
      {
        "id": "bc:Swx2POATmF9BJutS2DUMZ"
      }
    ]
  },
  "amount": {
    "amount": "300",
    "currency": "usd"
  },
  "name": "Updated January payment",
  "description": "Updated January payment and distribution",
  "paymentInstrument": {
    "id": "bc:SqHIz10LI89qiZMapbZGf"
  },
  "receivedDate": "2025-06-12",
  "referenceNumber": "bc:434923408"
}
}
}

```

The request returns the modified payment and a 200 response. The modified payment has a different id than the original payment, because it is a different entity in the database.

As a result of the modification, the modified payment has:

- Seven distribution items - One of them is reversed, and does not appear in the user interface. The other six are not reversed. One of the six items is a modifying distribution item.
- Three suspense items - One of them is reversed, and does not appear in the user interface. The other two are not reversed. One of the six items is a modifying distribution item.
- An amount of \$300.
- A new name, description, payment instrument, received date, and reference number.

Modifying saved agency bill payments

If a payment is in the saved state, modifying it does not create a new payment entity in the database, and it does not create new distribution items or suspense items. Instead, BillingCenter modifies the original payment entity and any of its distribution or suspense items directly. This is because no transactions have occurred for the saved payment, and therefore no new transactions must be created to offset the original payment transactions.

Execute saved agency bill payments

When a saved agency bill payment is executed, it is saved to the BillingCenter database. Financial transactions are created for the payment, T-account amounts are adjusted to reflect the payment. The executed payment is distributed using the distribution items, and the suspense items are added to a suspense T-account. If there are no distribution items and no suspense items, the payment cannot be executed.

Use the following endpoint to execute saved agency bill payments:

- POST /billing/v1/producers/{producerId}/ab-money-rcvds/{agencyBillMoneyRcvdId}/execute

No request body is required.

A 200 response is returned if the request is successful. The executed payment is returned, with the `saved` field set to `false`.

Delete agency bill payments

You can delete saved agency bill payments using the following endpoint:

- DELETE /billing/v1/producers/{producerId}/ab-money-rcvds/{agencyBillMoneyRcvdId}

You can only delete payments that are in the saved state. For example, the following call deletes payment bc:822 on producer bc:190.

```
DELETE /billing/v1/producers/bc:190/ab-money-rcvds/bc:822
```

No request body is required. A 204 response is returned if the delete is successful.

Payment mismatch exceptions

Agency bill payments are typically more complex to process than direct bill payments. For example, a producer may provide a net amount that is less than or greater than the amount of the invoice item, or the producer might withhold more commission than is on the invoice item.

To reduce the complexity of agency bill payments and to help manage the distribution process, BillingCenter uses payment mismatch exceptions. A *payment mismatch exception* is a record of a mismatch between the amount of payment expected for a specific invoice item and the amount of payment received.

Retrieve payment mismatch exceptions

Use the following endpoint to retrieve all of a producer's agency bill exceptions:

- GET /billing/v1/producers/{producerId}/agency-bill-payment-exceptions

This retrieves all exceptions that have been created for a producer. For example, the following retrieves all exceptions on producer bc:372. In this case, there are two agency bill exceptions.

Command

```
GET /billing/v1/producers/bc:372/agency-bill-payment-exceptions
```

Response

```
{
  "count": 2,
  "data": [
    {
      "attributes": {
        "commissionDifference": {
          "amount": "-1.94",
          "currency": "usd"
        },
        "createDate": "2024-12-08T15:57:13.618Z",
        "grossDifference": {
          "amount": "-19.38",
          "currency": "usd"
        },
        "invoiceItem": {
          "displayName": "12/08/2024 ($81.82)",
          "id": "bc:476",
          "type": "InvoiceItem",
          "uri": "/billing/v1/charges/bc:SZzxc-1k8_xRc5qP5HBVQ/invoice-items/bc:SMNTjPJNZmRU53vhF0xvW"
        },
        "issueDescription": "Gross and Commission Mismatch"
      },
      "checksum": "5"
    },
    {
      "attributes": {
        "commissionDifference": {
          "amount": "1.33",
          "currency": "usd"
        },
        "createDate": "2025-02-08T16:03:24.312Z",
        "grossDifference": {
          "amount": "0.00",
          "currency": "usd"
        }
      }
    }
  ]
}
```

```

    "invoiceItem": {
      "displayName": "01/08/2025 ($77.73)",
      "id": "bc:477",
      "type": "InvoiceItem",
      "uri": "/billing/v1/charges/bc:SA-4Cu0hZNRtUfrX9sXat/invoice-items/bc:SwizKDk04b-8tDMWHvw14"
    },
    "issueDescription": "Commission Mismatch"
  },
  "checksum": "3"
}
...
}

```

To return additional fields on the exception, such as information on the policy and statement, add the query parameter `?fields=*detail`.

Resolve payment mismatch exceptions

There are a variety of ways that payment mismatches can be resolved. The full list can be found in *Application Guide*.

Cloud API supports the following options for resolving payment mismatch exceptions:

- Write off - Write off the gross amount, the commission amount, or both.
- Carry forward - BillingCenter removes the exception status from the invoice item, even if the invoice item remains unsettled. No other exceptions are raised on that invoice item, except if another distribution is made or modified against that invoice item. (Note that this option does not entail moving the invoice item to another statement invoice.)

Payment mismatch exception endpoint structure

From a data model perspective, exceptions are not stored in the BillingCenter databases as entities. Instead, they are calculated from a filtered set of invoice items and related objects and are generated at runtime when retrieved. This is why there is no ability to GET a single exception.

You must resolve payment mismatch exceptions by targeting the unsettled invoice items themselves. After retrieving a producer's exceptions, you can use the URI in the exception's `invoiceItem` field to access the related invoice item, and then call the relevant endpoint to resolve that item's exception.

Write off exceptions

You can write off a payment mismatch exception to resolve it. This means that the amount owed will not be collected, or the amount due will not be paid out.

Write off exceptions using the following endpoint:

- POST `/charges/{chargeId}/invoice-items/{invoiceItemId}/agency-bill-exception-write-off`

Payment mismatch exceptions can be related to a commission mismatch, a gross mismatch, or both. When writing off payment mismatch exceptions, all mismatches (both commission and gross) must be resolved for the exception to be resolved.

You can specify which values are written off in the POST request body. The following fields are required:

- `agencyWriteoffType` - Which difference to write off, as a typekey reference. Can be `commission`, `gross`, or `both`.
- `writeOffReason` - Typekey reference to the `WriteOffReason` typelist.

For example, the following request writes off both the gross and the commission difference for the invoice item `bc:476`.

Command

```
POST /billing/v1/charges/bc:349/invoice-items/bc:476/agency-bill-exception-write-off
```

Request body

```
{
  "data": {
```

```

    "attributes": {
      "agencyWriteoffType": {
        "code": "Both"
      },
      "writeoffReason": {
        "code": "Negotiation"
      }
    }
  }
}

```

Carry forward exceptions

You can also resolve a payment mismatch exception by carrying it forward. Carrying forward an exception essentially means that BillingCenter removes the exception for that invoice item and places a “lock” on the invoice item. This means that another exception is not raised on it, unless another distribution is made or modified against that invoice item and the amount remains unsettled.

It is important to note that carrying forward an exception does not move the invoice item in question to another statement invoice.

Carry forward an exception using the following endpoint:

- POST /charges/{chargeId}/invoice-items/{invoiceItemId}/agency-bill-exception-carry-forward

No request body is required.

Command

```
POST /billing/v1/charges/bc:349/invoice-items/bc:476/agency-bill-exception-carry-forward
```

Request body

```
<empty>
```

Agency bill suspense items

When creating an agency bill payment, you can also create a series of agency bill suspense items. *Suspense items* are payment items where the producer exists in BillingCenter, but the target policy, policy period, charge, or invoice item does not.

For example, a BillingCenter user might create agency bill suspense items when a producer sends a payment for a policy that is not yet bound, and thus does not yet exist in BillingCenter. BillingCenter holds the suspense item funds until they can be released and added to the producer’s unapplied fund. For more information, see the *Application Guide*.

You can retrieve, create, and release agency suspense items using Cloud API.

Retrieve agency bill suspense items

GET agency bill suspense items using the following endpoints:

- GET /producers/{producerId}/ab-money-rcvds/{agencyBillMoneyRcvdId}/agency-cycle-payments/{agencyCyclePaymentId}/agency-suspense-payment-items
- GET /producers/{producerId}/ab-money-rcvds/{agencyBillMoneyRcvdId}/agency-cycle-payments/{agencyCyclePaymentId}/agency-suspense-payment-items/{agencySuspPmntItemId}

For example, the following demonstrates GETting all agency bill suspense items associated with an agency cycle payment.

Command

```
GET /billing/v1/producers/bc:192/ab-money-rcvds/bc:872/agency-cycle-payments/bc:873/agency-suspense-payment-items
```

Response

```
{
  "count": 1,

```

```

    "data": [
      {
        "attributes": {
          "commissionAmountToApply": {
            "amount": "8.00",
            "currency": "usd"
          },
          "currency": {
            "code": "usd",
            "name": "USD"
          },
          "grossAmountToApply": {
            "amount": "40.00",
            "currency": "usd"
          },
          "id": "bc:SLpIWv30fRhUHVz6Dji11",
          "paymentComments": "Payment for pc:9108, which is not yet bound",
          "policyNumber": "pc:9108"
        },
        ...
      }
    ]
  }
}

```

Not all fields are returned by default. Use the `?fields=*all` query parameter to return additional fields such as `status`, `executedDate`, and `releasedDate`.

Create agency bill suspense items

Agency bill suspense items are created in a similar manner to distribution items in Cloud API: they are created in “the call to create the agency bill payment”.

When creating an agency bill payment through Cloud API, you can create agency bill suspense items or distribution items or both. Like distribution items, you can provide agency bill suspense items in the `agencyCyclePayment` object. Suspense items are specified in the `agencySuspPmntItems` array.

For each suspense item, the following fields are required:

- `grossAmountToApply` - The gross amount of the suspense item
- `commissionAmountToApply` - The commission amount of the suspense item
- `currency` - The currency, as a typekey reference

You can also include the expected policy number using the `policyNumber` field, though it is not required.

The following example call demonstrates creating an agency bill payment with:

- An agency bill suspense item of \$50 gross with \$5 commission
- A distribution item of \$100 gross minus \$10 commission

Command

```
POST /billing/v1/producers/bc:192/ab-money-rcvds
```

Request body

```

{
  "data": {
    "attributes": {
      "agencyCyclePayment": {
        "agencySuspPmntItems": [
          {

      },
      "currency": {
        "code": "usd"
      },
      "disposition": {
        "code": "autoexception"
      },
      "grossAmountToApply": {
        "amount": "100.00",
        "currency": "usd"
      }
    },
    "currency": {
      "code": "usd"
    }
  },
  "amount": {
    "amount": "99.50",
    "currency": "usd"
  },
  "currency": {
    "code": "usd"
  },
  "paymentInstrument": {
    "id": "bc:SvIIFL6cLwCgnBuL6kNeJ"
  },
  "receivedDate": "2024-06-23"
}
}
}

```

If the request returns a 201 response, the payment, distribution, and suspense items have been created. The POST request returns information about the payment, but no information about the suspense items or distribution.

Releasing agency bill suspense items

When an agency bill suspense item is released, the net funds are moved from a suspense T-account to the producer's unapplied fund. You can release an agency bill suspense item through Cloud API.

Use the following endpoint to release an agency bill suspense item:

- POST /producers/{producerId}/ab-money-rcvds/{agencyBillMoneyRcvdId}/agency-cycle-payments/{agencyCyclePaymentId}/agency-suspense-payment-items/{agencySuspPmntItemId}/release

No request body is needed. For example:

Command

```
POST /billing/v1/producers/bc:192/ab-money-rcvds/bc:872/agency-cycle-payments/bc:873/agency-suspense-payment-items/bc:874/release
```

Request body

```
<no request body>
```

To be released, the suspense item must have a status of *Executed*.

Agency bill disbursements

An agency bill disbursement is an object used to return money that is related to an agency bill policy to a producer. Typically, agency bill disbursements are created because a producer overpaid for a given statement.

Agency bill disbursements are created manually. In some cases, agency bill disbursements require approval in order to be paid out to the recipient. BillingCenter pays agency bill disbursements by sending money from the producer's unapplied fund to the payee.

For more information, see the *BillingCenter Application Guide*.

You can retrieve, create, modify, reject, and approve agency bill disbursements through Cloud API.

Retrieve agency bill disbursements

Use the following endpoint to retrieve all of a producer's disbursements:

- GET /billing/v1/producers/{producerId}/disbursements

Use the following endpoint to retrieve an individual agency bill disbursement:

- GET /billing/v1/disbursements/{disbursementId}

These endpoints return disbursements of all statuses, whether they are pending, approved, sent, and so on.

For example, the following demonstrates retrieving all of a producer's disbursements:

Command

```
GET /billing/v1/producers/bc:435/disbursements
```

Response

```
{
  "count": 4,
  "data": [
    {
      "attributes": {
        "address": "e",
        "amount": {
          "amount": "200.00",
          "currency": "usd"
        }
      },
      "closeDate": "2025-03-13",
      "disbursementNumber": "100000001",
      "dueDate": "2025-07-16",
      "id": "bc:SgyU8VjhDtR891DpC1RGr",
      "mailto": "e",
      "payTo": "e",
      "paymentInstrument": {
        "displayName": "Responsive",
        "id": "bc:SQ3VcrkB9gH0Ar7dxempT",
        "type": "UniversalPaymentInstrument",
        "uri": "/billing/v1/universal-payment-instruments/bc:SQ3VcrkB9gH0Ar7dxempT"
      },
      "producer": {
        "displayName": "Red Apple Agency",
        "id": "bc:435",
        "type": "Producer",
        "uri": "/billing/v1/producers/bc:435"
      },
      "reason": {
        "code": "Overpay",
        "name": "Overpayment"
      },
      "status": {
        "code": "Sent",
        "name": "Sent"
      }
    },
    ...
  ]
}
```

Create agency bill disbursements

Use the following endpoint to create an agency bill disbursement:

- POST /billing/v1/producers/{producerId}/disbursements

The following fields are required when creating a producer disbursement:

Field	Description	Note
address	The address of the recipient, as a string	
dueDate	The date the outgoing payment is due to be created, as a datetime string	Cannot be in the past or before the payment date of the suspense payment

mailTo	The name of the recipient, as a string	By default this is the same as the payTo field, but can be different
payTo	The name of the payee, as a string	
reason	An entry in the Reason typelist (for example, Cancellation or PolicyChange)	
amount	The amount of the disbursement, as a monetaryAmount object	Must not be greater than the amount in the producer's unapplied fund

For example, the following request creates a producer disbursement with the minimum required fields.

Command

```
POST /billing/v1/producers/bc:2919/disbursements
```

Request body

```
{
  "data": {
    "attributes": {
      "address": "995 N. Wildflower Way",
      "dueDate": "2025-11-11",
      "payTo": "Allrisk Agency",
      "reason": {
        "code": "Overpay"
      },
      "amount": {
        "amount": "50",
        "currency": "usd"
      }
    }
  }
}
```

If the payment instrument is not specified, the producer's default payment instrument is used.

Other agency bill disbursement operations

You can modify, reject, and approve agency bill disbursements in the same manner as other types of disbursement. See the following topics:

- “Modifying disbursements” on page 305
- “Rejecting disbursements” on page 306
- “Approving disbursements” on page 306
